
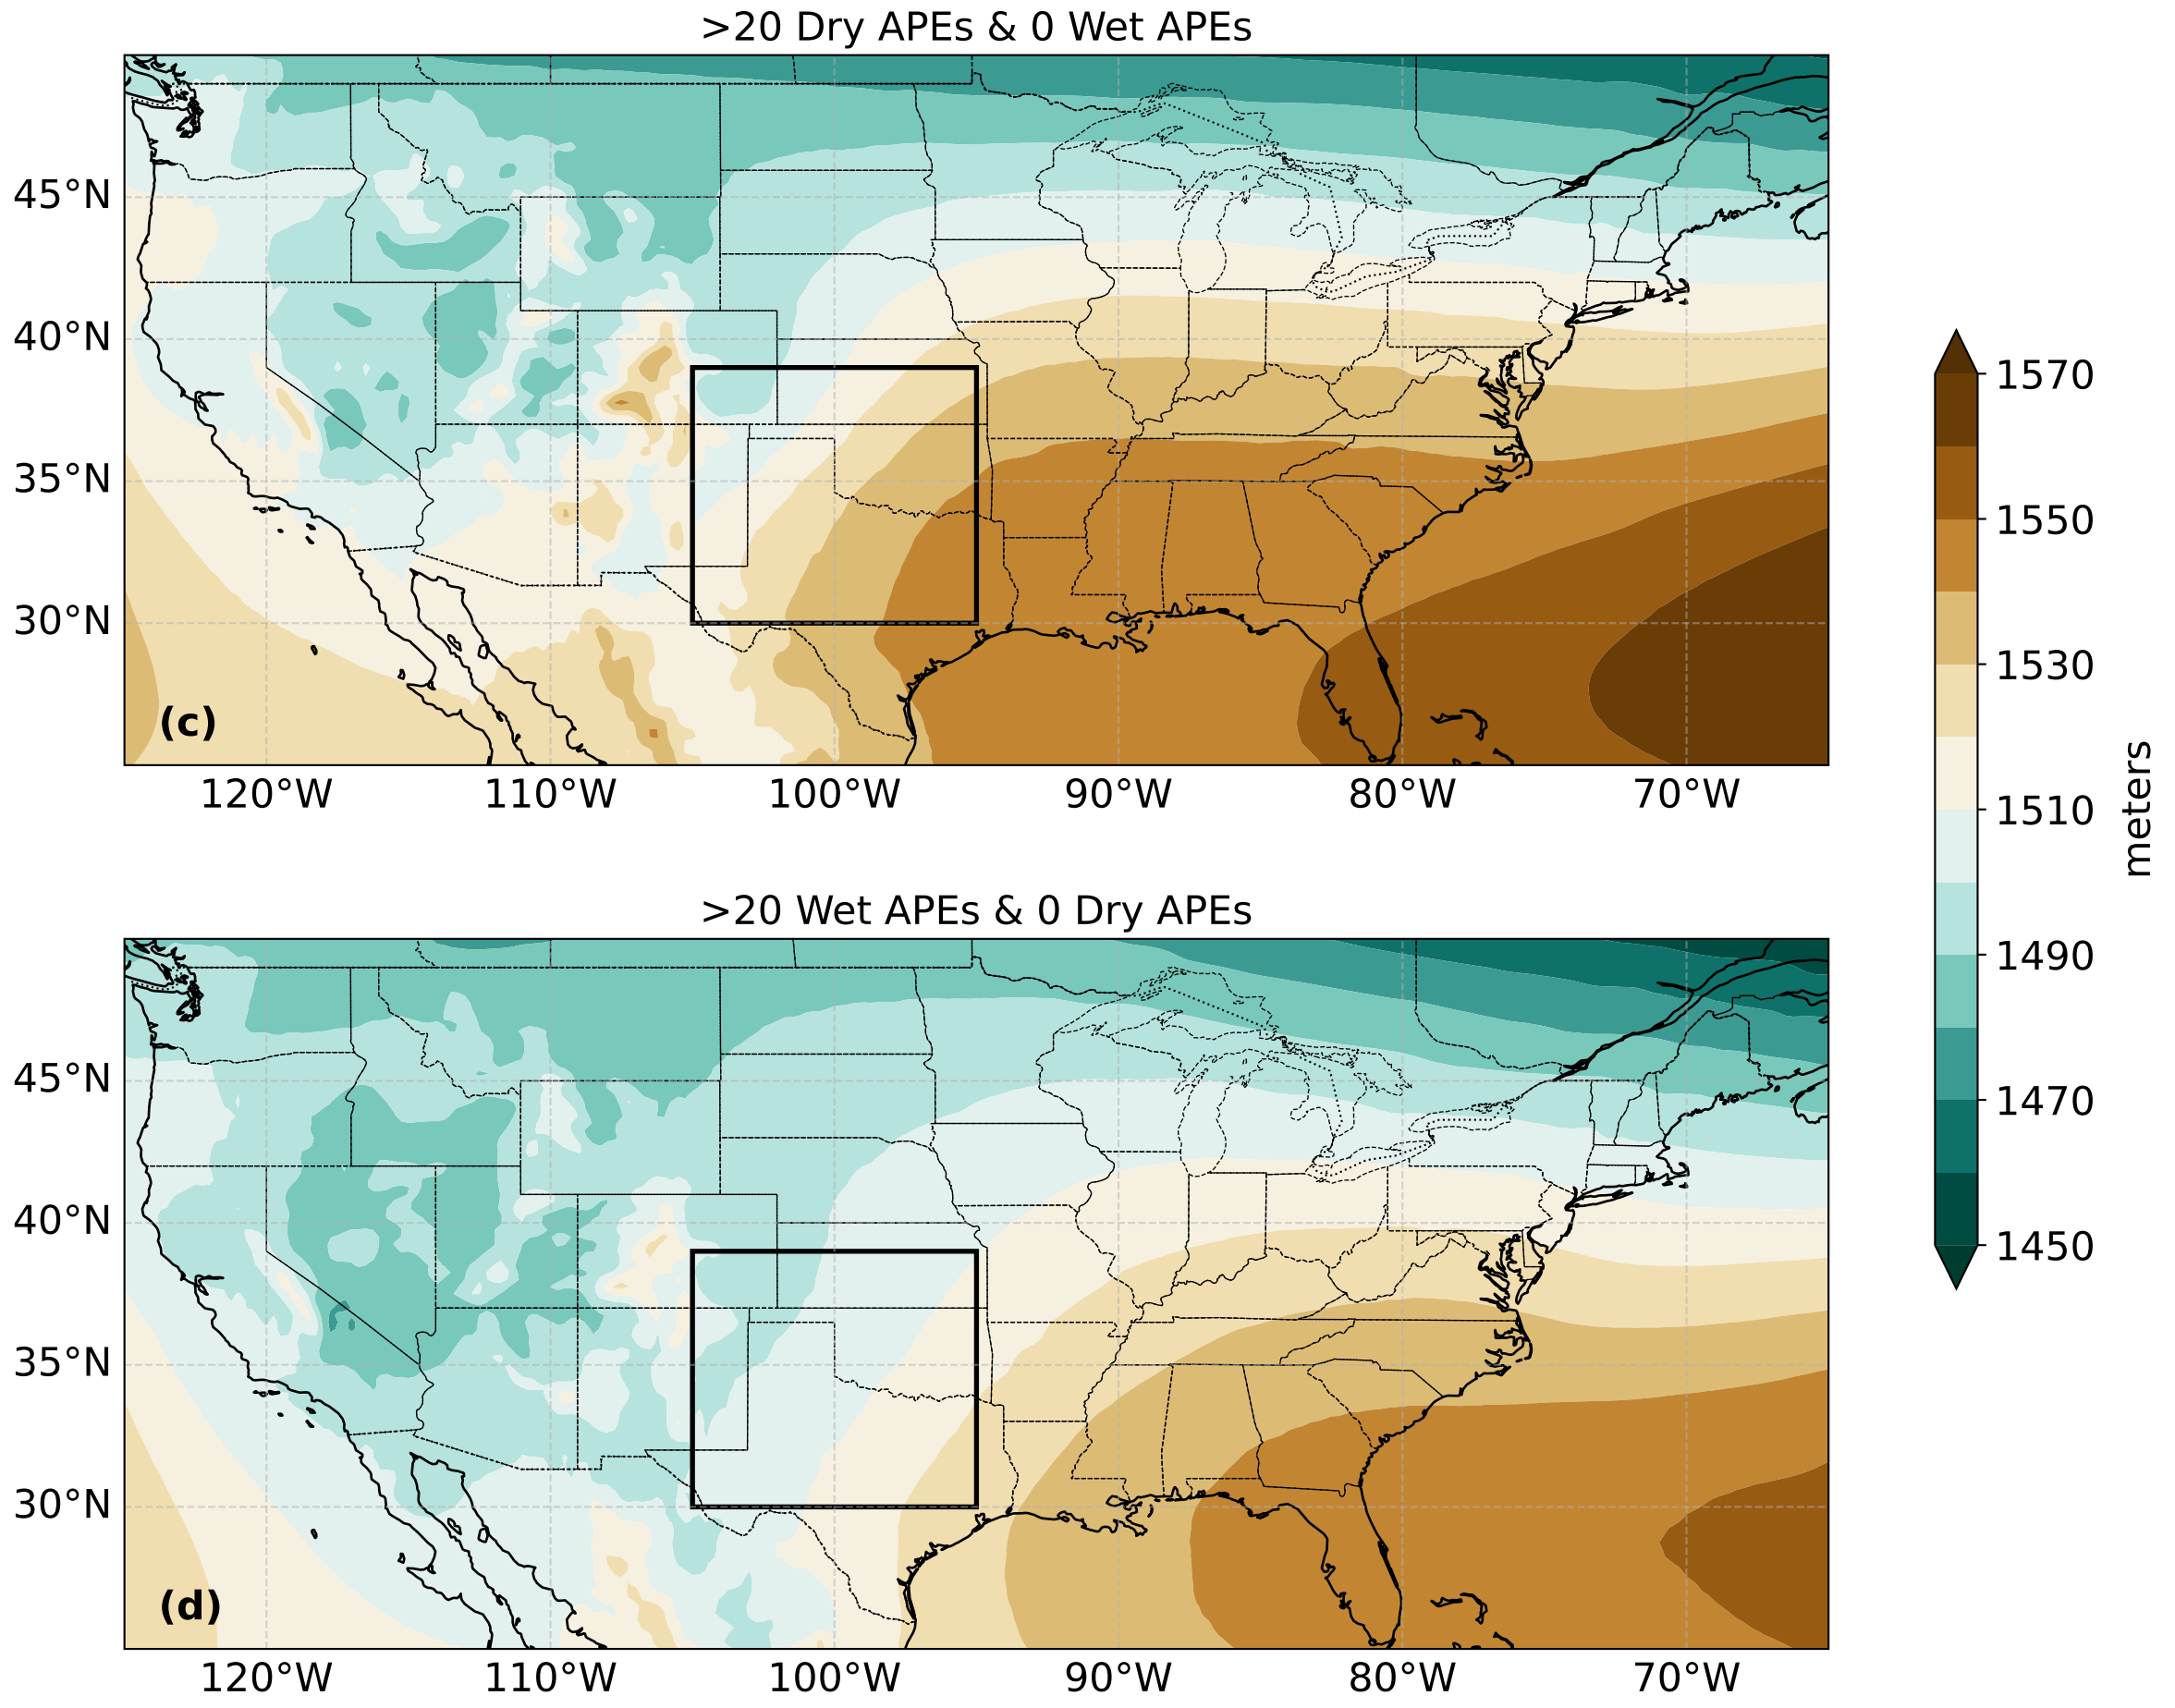

Figure 6. Composite 850 hPa geopotential height for days falling under (c) dry and (d) wet APE "preferred" regimes. A dry (wet) APE "preferred" regime is defined as days in which > 20 dry (wet) APEs occurred while 0 wet (dry) APEs occurred. The number of days used is n = 894 days for the dry regime and n = 407 days for the wet regime. The black box denotes the Southern Great Plains domain used in this study.
